Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/692,568	Applicant(s) BARROWS, BRUCE	
	Examiner Fadcy S. Jabr	Art Unit 3628	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 05 July 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-16 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Status of Claims

Claims 1, 3, 8 and 15 have been amended. Claims 1-16 remain pending and are again presented for examination.

Response to Arguments

1. Applicant's amendments filed 5 July 2007 with respect to the Objections have been fully considered and are therefore withdrawn.
2. Applicant's amendments filed 5 July 2007 with respect to the 35 U.S.C. 112, second paragraph have been fully considered and are therefore withdrawn.
3. Applicant's arguments filed 5 July 2007 with respect to the 35 U.S.C. 103(a) have been fully considered but they are not persuasive.
4. Applicant argues that neither Brookner, Lau nor the Pintsov reference teach defining the mail piece blocks, identifying gaps between the defined mail piece blocks, or accounting for the mail pieces within the gaps. However, Examiner notes that Brookner discloses customer accounting is based on statistical data gathered by the postage printing base (0014). Further, Brookner discloses when a mail piece is franked, stored statistical data may include the mail piece category, weight, or amount...should a mail piece be the first of its type or category, a new batch identifier with the mail piece identity may be established in the storage location (defining mail piece blocks) (0016). Moreover, Applicant argues that none of the references teaches balancing postage fund accounts for mail pieces that were produced. Brookner discloses

Art Unit: 3628

statistical data (such as batch data) may well include the ascending and/or descending register and the item counter, and this will permit straightforward screening of data for plausibility (0041).

Further, Lau teaches during mail piece processing, the inserter system tracks and reports back to the office manager server (OMS) the damaged, duplicate or missing mail pieces within the data block. The inserter system notifies the IMS when the last mail piece has been processed...identifies all mail pieces not processed for the mail run (identifying gaps between the defined mail piece blocks, and accounting for mail pieces within the gaps). (C. 3, lines 15-23).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims **1-16** are rejected under 35 U.S.C. 103(a) as being unpatentable over Brookner et al., Pub. No. US2004/0193547 A1 in view of Lau et al., U.S. Patent No. 5,777,883 and Pintsov, U.S. Patent No. 6,009,416, hereinafter referred to as Brookner, Lau and Pintsov respectively.

As per **Claim 1-2**, Brookner discloses a batch mailing method comprising:

- gathering register information from the postage meter while forming mail pieces, the register information including an ascending register of postage funds printed by the

Art Unit: 3628

- postage meter, a descending register of postage funds available for printing by the postage meter, and a piece count (0010, 0013-0014, 0027, 0041, 0057, 0066);
- defining mail piece blocks based on gathered register information, the step of defining including assigning individual mail pieces to mail piece blocks using the following steps (0016):
 - comparing the register information for the particular mail piece as a function of the register information of a prior mail piece (0041).

Brookner fails to *explicitly* disclose receiving register information indicating register status after a particular mail piece is processed; if the comparison is consistent with the processing of a single mail piece, then assigning the particular mail piece to a same mail piece block as the prior mail piece, and otherwise assigning the particular mail piece to a new mail piece block.

However, Brookner discloses when a mail piece *is franked*, stored statistical data may include the mail piece category, weight, or amount. This is added to a like batch history. Should *a mail piece be the first of its type or category*, a new batch identifier with the mail piece identity may be established in the storage location (0014, 0016, 0041). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include receiving category, weight, or amount (e.g. value left within the PSD) and also assign a mail piece with the same statistical information to the same batch block as the prior mail piece, because it allows the system to sort mail pieces which belong another mail batch based on postage data.

Brookner fails to disclose forming mail pieces on an inserter machine, the inserter machine comprising a postage meter for printing postage value on the mail pieces. However,

Art Unit: 3628

Brookner discloses where a postal security device (PSD) is used on different postage printing bases (PPBs) (0010, 0057, 0066). Moreover, Pintsov teaches a secure trusted account device is connected directly to the inserter control computer (C. 1, lines 43-45, C. 4, lines 20-23, C. 8, lines 57-64). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include a postage meter connected to the inserter system as taught by Pintsov, because the secure trusted account device provides information concerning the operation of the physical preparation of the mail by the inserter system (C. 9, lines 13-15).

Brookner fails to disclose identifying gaps between mail piece blocks and mail pieces within the gaps; and accounting for the mail pieces within the gaps in accordance with a predetermined algorithm, the step of accounting further including considering a subset of mail piece blocks as proximal to the identified gaps. However, Lau teaches during mail piece processing, the inserter system tracks and reports back to the office manager server (OMS) the damaged, duplicate or missing mail pieces within the data block. The inserter system notifies the IMS when the last mail piece has been processed...identifies all mail pieces not processed for the mail run (C. 3, lines 15-23). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include identifying all mail pieces not processed for the mail run as taught by Lau, because it allows the system to ensure all mail pieces have been accounted for in the batch.

As per **Claim 3**, Brookner discloses based on ending ascending or descending register information and the postage meter print value setting information for the mail pieces, calculating

Art Unit: 3628

beginning ascending or descending register information for the particular mail piece before processing and comparing the beginning ascending or descending register information for the particular mail piece with the ending ascending or descending register information of the immediately prior mail piece to determine if the comparison is consistent with processing of a single mail piece (0016, 0027, 0041).

As per **Claim 4**, Brookner discloses wherein the step of comparing the register information for the particular mail piece further comprises comparing a piece count for the particular mail piece with the piece count for the prior mail piece, and assigning the particular mail piece to a same mail piece block as the prior mail piece if there is an interval of one mail piece, and otherwise assigning the particular mail piece to a new mail piece block (0016, 0027, 0041).

As per **Claim 5-6**, Brookner fails to disclose determining if mail piece blocks include overlapping mail piece information and eliminating duplicate data so that the same information is only accounted for once; and defining a negative block corresponding to the overlapping mail piece information. However, Lau teaches when duplicate material has been detected the OMS denies the download request to the ISC. Further, if the mail piece has been processed by ISC1, ISC2 receives a download denied response from IMS, which indicates duplicate material (C. 4, lines 27-49). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include denying processing of a

Art Unit: 3628

duplicate mail piece as taught by Lau, because it prevents the user's account from being accounted more than once for the same mail piece.

As per Claim 7-9 and 14-15, Brookner fails to disclose defining a startpoint for performing balancing and an endpoint for performing balancing and whereby the startpoint and the endpoint encompass an identified gap and mail piece blocks bordering on the identified gap and whereby the step of accounting considers a range between the defined startpoint and endpoint, including mail piece blocks and the identified gap, for the purposes of the predetermined algorithm; wherein neither the startpoint nor the endpoint occur inside a mail piece block, and whereby only one block ends at the startpoint and only one blocks starts at the endpoint; wherein the step of identifying gaps includes sorting mail piece blocks in consecutive order to find gaps. However, Lau teaches if the mail piece has not been processed, the ISC1 sets a new end of block to the mail piece immediately preceding the requested piece, and OMS downloads the requested block to ISC2. Further, if the mail piece has been processed by ISC1, ISC2 receives a download denied response from IMS, which indicates duplicate material (i.e., the mail pieces are accounted for consecutively, despite being on separate inserters)(C. 4, lines 27-49). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include consecutively accounting for mail pieces where one mail piece block begins where another mail piece block ends as taught by Lau, because it allows the system to determine damaged, duplicate and missing mail pieces.

As per **Claim 10 and 12-13**, Brookner fails to *explicitly* disclose the step of accounting includes creating a discrepancy block to fill an identified gap where a starting ascending register value of a second block is greater than a starting ascending register value of a preceding first block. However, Brookner discloses ascending, descending register and a piece count (0027). It is old and well known in the art at the time of the applicant's invention to have an ascending register value (a register value indicating the total postage value consumed) of a postage meter greater than the previous ascending register value. Further, descending register keep track of the postage value remaining in the meter after a transaction, and would therefore have a lesser value after each transaction. Moreover, a piece count increments each mail piece for each transaction and therefore would start the counter for the next transaction where the prior transaction ended. Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include an ascending register value that increases after a postage transaction, because ascending registers keep track of the total amount of postage issued over time.

As per **Claim 11**, Brookner fails to disclose wherein the step of accounting includes creating a negative block to cancel an overlap when the starting ascending register value of the second block is less than the starting ascending register value of the first block. However, Lau teaches if the mail piece has already been processed the system receiving a download denied response from the OMS indicating duplicate material (C. 4, lines 27-49). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include denying further processing of the same mail piece as

Art Unit: 3628

taught by Lau, because it prevents the system for accounting for the same mail piece more than once.

As per **Claim 16**, Brookner fails to disclose whereby the accounting steps are iterated for all blocks at or between the defined startpoint and endpoint. However, Lau teaches if the mail piece has not been processed, the ISC1 sets a new end of block to the mail piece immediately preceding the requested piece, and OMS downloads the requested block to ISC2 (C. 4, lines 27-49). Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to modify the method of Brookner and include accounting for the blocks at their startpoint as taught by Lau, because it provides the system with time to determine whether the mail piece has been previously detected.

Conclusion

Examiner's Note: Examiner has cited particular columns and line numbers in the references as applied to the claims below for the convenience of the applicant. Although the specified citations are representative of the teachings in the art and are applied to the specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested that the applicant, in preparing the responses, fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the examiner.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Fadey S. Jabr whose telephone number is (571) 272-1516. The examiner can normally be reached on Mon. - Fri. 7:30am to 4:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John Hayes can be reached on (571) 272-6708. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
